

ABSTRACT OF THE DISCLOSURE

5 A pressure applicator for applying pressure to a flowable implant material,
e.g., PMMA. A pressure applicator or driver includes a pair of columns which are
engageable with one another, preferably by threads to generate a driving pressure. A
10 handle is provided for the operator to grasp and steady the device as he turns the
handle to apply pressure to the implantable material within the applicator. A luer-
lock or other connecting device is provided for attaching the applicator to a cannula
(or a connecting conduit that in turns connects with a cannula) that will deliver the
implant material to the desired site. Pressures of about 1000-3000 psi may be
generated by this device.
